

Can a concentrated solar power plant with an electric heater join peak regulation?

Therefore, a concentrated solar power (CSP) plant equipped with an electric heater (EH) is implemented to join the peak regulation, and the joint peak regulation strategy between thermal power units (TPUs) and a CSP plant is proposed. Firstly, the peak regulation principle of a CSP plant with EH is analyzed in detail.

What is the peak load demand of a solar system?

It can be observed from Fig. 4 that the peak load demand of the system is 1500 MW at 12th hour. The next subsequent peak of 1400 MW is observed at 20th hour of the next day. In this case study, load uncertainty is introduced on the maximum side, with the upper bound established as mentioned in Eq. (18), in the absence of PV-ES.

What is the optimal operation strategy for joint peak regulation of CSP plant?

On this basis, an optimal operation strategy of joint peak regulation of the CSP plant and TPUs is proposed, considering both spinning reserve and energy conversion. The major contributions of this paper are summarized as follows: The peak regulation mechanism of the CSP plant equipped with EH is analyzed in detail.

Can a centralized single-agent RL control system optimize energy consumption?

In this paper, we propose a centralized single-agent RL control system designed to optimize the energy consumption of a cluster of four buildings by controlling their thermal energy storage systems (hot and chilled water tanks). The aim is to reduce peak energy demand while ensuring occupant comfort.
