Are hamster cells solar powered?

University of Tokyo. "Solar-powered animal cells." ScienceDaily. ScienceDaily, 30 October 2024. < / releases / 2024 / 10 / 241030150215.htm>. Energy-making chloroplasts from algae have been inserted into hamster cells, enabling the cells to photosynthesize light, according to new research in Japan.

Are 'planimal' cells beneficial to animals?

The team is continuing its research on creating "planimal" cells that can provide the beneficial features of plants to animals. In this study, it found that animal cells which contained chloroplasts experienced an increased cell growth rate, suggesting that the chloroplasts provided a carbon source (fuel) for the host cells.

Do animals have photosynthetic abilities?

The idea of animal cells adopting photosynthetic abilities may sound like science fiction, but some animals, like giant clams, already benefit from partnerships with photosynthetic organisms. These clams harbor algae that use chloroplasts to photosynthesize, providing oxygen and food to their host.

Do corals store photosynthetic cargoes?

Mounting evidence suggests that corals can regulate the abundance of their symbionts by digesting or expelling them.<sup>33,34,35,36,37,38</sup> Therefore, the storage of functional, photosynthetic cargoes within arrested organelles has convergently evolved in sea slug mollusks and cnidarians, including corals and anemones (Figure 5 A).

Cryopreservation of fish gonadal tissue is an important technique for preserving genetic variability. However, this technique involves the use of cryotubes, plastic containers with low degradability that ...

Public health concern associated with the ingestion of microplastics (MPs) released from water packaging materials is increasing. The use of plastic materials for solar disinfection (SODIS) ...

The present disclosure relates generally to tissue container systems and kits that find use in the transport of tissues and methods of using the tissue container systems. In particular, systems and kits ...

Researchers at the University of Tokyo, Japan, have successfully implanted chloroplasts from algae into hamster cells, enabling animal cells to photosynthesize for up to two days.

Scientists in Japan have created hybrid plant-animal cells, essentially making animal cells that can gain energy from sunlight like plants. ...

With the world moving increasingly towards renewable energy, Solar Photovoltaic Container Systems are an efficient and scalable means of ...

In a universe where electricity isn't always where--or when--it's needed, a mobile solar container is an easy, fuel-efficient power solution. ...

Japanese researchers have successfully engineered hybrid animal cells capable of photosynthesis, a process typically exclusive to plants and algae. The breakthrough could have profound implications ...

By incorporating chloroplast-infused cells, researchers could supply oxygen via light exposure, creating better growth conditions for complex, ...

Animal cell culture technology in today's scenario has become indispensable in the field of life sciences, which provides a basis to study regulation, proliferation, and ...

Glycosidases present at high activities in locule tissue included  $\alpha$ - and  $\beta$ -galactosidases,  $\beta$ -mannosidase,  $\beta$ -arabinosidase, and  $\beta$ -glucosidase. The results confirm our earlier findings that the ...

Tissues can struggle to grow due to a lack of oxygen, but adding chloroplast-infused cells could enable oxygen and energy to be supplied through light exposure and photosynthesis.

The tissues were evaluated with hematoxylin and eosin; IHC: thyroid transcription factor, muscle-specific actin, hepatocyte-specific antigen, and common acute lymphoblastic leukemia ...
