

Bismuth Ferrites: Synthesis Methods and Experimental Techniques This chapter is mainly concerned with the synthesis methods available for preparing bismuth ferrites either in powders or in thin-films. ...

The present work delivers the first assessment of BiFeO₃ (BFO) thin films as an absorber for sustainable all-oxide photovoltaic devices. Films are deposited from a metal-organic ...

Ferroelectric photovoltaic devices were assembled by direct stacking of bismuth ferrite (BFO) thin film with titanium dioxide (TiO₂) thin film deposited on fluorine tin oxide (FTO) substrates. ...

Bismuth Ferrite thin film has a significant saturation polarization (90 C/cm²) and a band gap (E.g., 2.67 eV) that is narrower than many other ferroelectric perovskites, making it a promising ...

The present work delivers the first assessment of BiFeO₃ (BFO) thin films as an absorber for sustainable all-oxide photovoltaic devices. Films are deposited from a metal-organic precursor ...

One crucial drawback with most photocatalysts is that their activation energy lies in the UV region, which is a small part of solar radiation [9]. The perovskite-structured multiferroic bismuth ...

Bismuth ferrite BiFeO₃ (BFO)-based ferroelectrics have great potential as inorganic perovskite-like oxides for future solar cells applications due to their unique physical properties. In this work, La and ...

The objective of this work is therefore to optimize the physicochemical properties of BFO and BMO films prepared by spray pyrolysis, in order to assess their potential as low-band-gap ...

The particles were then deposited on bismuth ferrite (BiFeO₃) thin films via the drop-casting technique and the light trapping effect was studied by specular reflectance. Two ...

Nanocrystalline bismuth ferrite thin films co-doped with Gd and Mn were successfully fabricated via sol-gel spin coating method onto the corning glass substrate. The effect of Gd and Mn ...

Perovskite Bismuth ferrite and Mn-doped bismuth ferrite films were grown on FTO substrates via the sol-gel route using a spin coating technique. The XRD analysis has provided data ...

Bismuth Ferrite (BiFeO₃) and its doped materials have gained a lot of attention nowadays due to its very narrow band gap (~2.1 eV), recycling nature, coexistence of magnetic and ...

A heterostructure (bismuth ferrite/zinc oxide) device is fabricated with different types of the electrode to

Bismuth ferrite thin film solar container

enhance the power conversion efficiency (PCE). A single-phase multiferroic BFO thin ...

Researchers recently identified the optimal laser energy for crafting BFO/WO₃ bilayer thin films for solar cells at 200 millijoules (mJ), by carefully considering factors such as leakage...

In the current solar cell market, the commercialized crystalline silicon solar panels have high and stable conversion efficiency (>26%) and thus occupy most of the market share, while, their ...

When bismuth is grown in thin-film geometry, it exhibits unusual behavior as compared to its bulk properties. A lack of the large magnetoresistance effect is noted, as well as a decreasing resistivity ...

In this work, we investigated the bulk photovoltaic effect of bismuth ferrite (BFO) thin films. The BFO photovoltaic cell was constructed using a vertical structure between the transparent indium tin oxide ...

Vanadium Pentoxide and Bismuth Oxide Thin Films Deposition on PSi for Application in Solar Cells
