How are flow batteries classified?

Flow batteries can be classified using different schemes: 1) Full-flow (where all reagents are in fluid phases: gases, liquids, or liquid solutions), such as vanadium redox flow battery vs semi-flow, where one or more electroactive phases are solid, such as zinc-bromine battery. 2) Type of reagents: inorganic vs. organic and organic forms.

What is a flow battery?

A flow battery may be used like a fuel cell (where new charged negolyte (a.k.a. reducer or fuel) and charged posolyte (a.k.a. oxidant) are added to the system) or like a rechargeable battery (where an electric power source drives regeneration of the reducer and oxidant).

What is the difference between conventional and flow batteries?

The fundamental difference between conventional and flow batteries is that energy is stored in the electrode material in conventional batteries, while in flow batteries it is stored in the electrolyte.

Are flow batteries cost-efficient?

Flow batteries are normally considered for relatively large (1 kWh - 10 MWh) stationary applications with multi-hour charge-discharge cycles. Flow batteries are not cost-efficient for shorter charge/discharge times. Market niches include:

What is a flow-type battery?

Other flow-type batteries include the zinc-cerium battery, the zinc-bromine battery, and the hydrogen-bromine battery. A membraneless battery relies on laminar flow in which two liquids are pumped through a channel, where they undergo electrochemical reactions to store or release energy. The solutions pass in parallel, with little mixing.

Can flow batteries be recharged in situ?

Flow batteries can be rapidly "recharged" by replacing discharged electrolyte liquid (analogous to refueling internal combustion engines) while recovering the spent material for recharging. They can also be recharged in situ.
