

Direct absorption solar collection (DASC) chamber, as a basic and elementary structure for photo-thermal conversion, has widespread applications in solar heat collection and storage. ...

In these systems, solar thermal energy is used to "charge" an adsorbent by heating it to desorb an adsorbate from its surface. In TES systems, the charged adsorbate can be stored ...

This paper shows a comparison between an adsorption (ADC) and absorption cooling (ABC) systems to keep a building below the 25 °C set-point in dynamic conditions, utilizing a latent ...

These techniques strive to reduce solar cell temperatures by optimizing heat absorption within the absorber using different approaches. Their effects on thermal and electrical performance are ...

Research Paper Uniform temperature distribution and reduced convection losses: Top and bottom heating strategies for nanofluid and surface absorption-based solar thermal systems

With heat storage by absorption for building heating or cooling, the main application of the system is actually linked to long-term and in particular seasonal solar heat storage.

The heat transfer processes start from radiation heat exchange from the solar energy to the container surface. Radiation is the heat transfer from a body by virtue of its temperature; it ...

Data analysis shows that the direct effect of solar radiation on the container surface causes the temperature penetration of the container wall and increases the amount of energy ...

Therefore solar box is well insulation of rice husk; very good heat absorption of black coating, air tight aperture and adjustable reflector can improve good effect to the cooker efficiency. So, the design and ...

Thermal simulation was conducted with interactions between the container surfaces, taking into account the physical properties and environmental conditions, and the solar radiation is ...

Research Papers Heat absorption/release efficiency betterment of phase change material inside a shell-and-tube latent heat storage system under six different conditions of tube and fins
