What is new in solar PV material discovery?

These publications explore the frontiers of new classes of solar PV materials, including organic PVs and metal halide perovskites, and they also span different aspects from understanding photophysics, to improving device lifetimes, and exploiting robotics-based material screening for high-throughput PV material discovery.

What materials are used for flexible solar cells?

The common active materials for flexible solar cells are of three types: organic semiconductors, inorganic semiconductors, and hybrid semiconductors with both organic and inorganic materials. Common inorganic semiconductors for flexible and semi-flexible solar cells are crystalline silicon, amorphous silicon, CdTe, CIGS.

What are active-layer materials for solar cells?

We thoroughly discuss the active-layer materials for crystalline silicon (c-Si)-based solar cells (SC) and thin-film solar cells such as cadmium telluride (CdTe), as well as copper indium gallium diselenide (CIGS), amorphous thin-film silicon (a-Si), perovskite and organic solar cells.

How efficient are organic solar cells with 500 nm thickness?

Zhang, H. et al. Sequentially processed bulk-heterojunction-buried structure for efficient organic solar cells with 500 nm thickness. *Adv. Mater.* 36, 2400521 (2024). Zhu, L. et al. Efficient organic solar cell with 16.88% efficiency enabled by refined acceptor crystallization and morphology with improved charge transfer and transport properties.

Which solar cell materials are the most popular?

However, emerging solar-cell materials such as perovskite, organic solar cells, and quantum dots, due to their higher PCE and low cost of fabrication, are making their way toward commercialization. Transparent conductive oxides will continue to dominate as electrode materials with an increasing focus on conductive polymers.
