

Excited to announce a PhD opportunity at DTU Nanolab on microfabricating solar electrochemical capacitors for sustainable energy solutions. A chance to contribute to next-gen energy tech for ...

You will design and test photoelectrochemical reactors that integrate porous photovoltaic membranes with selective electrocatalysts in a flow cell system. By doing so, you will push the boundaries of solar ...

PhD position in Electrochemical Energy Storage and Conversion Our group studies fundamental processes in solutions, materials, and at the electrode-electrolyte interfaces using a combination of ...

About the Project Supervisory Team: Dr Jeng Yi Chong Project description: This project will develop an integrated membrane electrochemical system (MES) for efficient lithium separation and CO₂ capture. ...

The PhD project will focus on the development of innovative electrode materials for non-aqueous aluminium-ion batteries and aims to gain an in-depth understanding of the electrochemistry in AIBs.

The Bottom Line Electrochemical storage isn't tomorrow's technology - it's solving today's grid stability headaches. Whether you're balancing solar fluctuations or creating islandable microgrids, the right ...

This PhD project aims to address the key limitations of current bioresorbable electrochemical sensors. It introduces innovative materials and cleanroom-compatible fabrication processes to realize a dual ...

Join the SUN2CN project and develop next-generation solar-to-X devices that merge photovoltaics and electrochemistry for chemical production. As a PhD researcher, you will convert ...

II.4 Photo-electrochemical photo-electrochemical energy conversions is a long term option for meeting the world's future energy needs. Using solar photo-chemical and photo-electrochemical conversions, ...

As a PhD researcher, you will convert CO₂ and nitrates from waste streams into valuable C-N compounds, contributing to renewable energy and chemistry sectors. You will design and test ...

PhD in Inorganic Chemistry: Uppsala University, a leading research institution with a strong international reputation, invites applications for a PhD position in Inorganic Chemistry focusing ...

The PhD position is part of the HyCARB project, which brings together academic and industrial partners to develop competitive CO₂ utilization processes in the Netherlands. The research ...

The Department of Materials Engineering at the University of British Columbia is inviting applications for

Phd in electrochemical solar container

funded PhD positions in the Amini Lab. The successful candidates will ...

This project will develop an integrated membrane electrochemical system (MES) that enables efficient lithium recovery and CO₂ capture. By combining innovative membrane material design with advanced ...

Are you excited to work on photo/electrochemistry? In this PhD position, you will contribute to the SUN2CN project, developing a new solar-to-X device that uses sunlight as its sole ...

Phd in electrochemical solar container
