

Under the effective mass approximation and dielectric continuum model, based on the detailed balance model, the photoelectric conversion efficiency, open circuit voltage and short circuit current density of ...

The global pursuit of sustainable energy solutions has driven significant research into advanced photovoltaic technologies that can overcome the efficiency and cost limitations of ...

Semiconductor quantum dots used in so-called "third-generation" solar cells have the potential to dramatically increase--in some cases even double--the efficiency of converting sunlight to electricity. ...

Quantum dot semiconductors have gain great attraction for the development of high efficiency solar cells due to remarkable optoelectronic properties such as tunable bandgap, multiple exciton generation ...

Quantum dot (QD) has emerged as a promising agent in the field of solar energy conversion due to its distinct size-dependent optoelectronic characteristics. As next generation solar ...

The demand for sustainable energy continues to grow due to the depletion of traditional energy sources. Photovoltaics (PVs) are among the most effective energy harvesting technologies ...

The complete quantum dot sensitized solar cells, assembled by different prepared counter electrodes, were evaluated to compare the electrochemical properties of the FTO@rGO-Cu₂ ...

The use of quantum dots has also played an important role in the efficiency of these cells and their efficiency. The TiO₂@ZnO nanocomposite was selected and synthesized for this study.

Quantum Dots (QDs) have emerged as a class of initiators for photopolymerization, which usually relies on photoinduced charge transfer from QDs to molecular co-additives. Here the ...

Among these emerging technologies, quantum dot solar cells (QDSCs) stand out as promising candidates due to their unique optoelectronic properties, tunable bandgaps, and potential ...

Thin-film solar cells are more promising for low-cost and large-area photovoltaic devices. Tremendous efforts have been invested in using cadmium telluride (CdTe), copper indium ...

It attempts to replace bulk materials such as silicon, copper indium gallium selenide (CIGS) or cadmium

telluride (CdTe). Quantum dots have bandgaps that are adjustable across a wide range of energy levels by changing their size. In bulk materials, the bandgap is fixed by the choice of material(s). This pr...

Zero-dimensional semiconductor quantum dots (QDs) offer strong light absorption and bright narrowband emission across the visible and infrared wavelengths and have been engineered ...
