

This article considers the stochastic characteristics of the regenerative braking power distributed in railway power networks. It concurrently optimizes the train trajectory with OESS and regenerative ...

In order to increase the utilization rate of regenerative braking energy, reduce the operation cost and improve the power quality of traction power supply system in high-speed railway. ...

The proposed Case 4, integrating ESS, RB and solar generation for the combined railway and EV charging demand, is still the most profitable case across multiple scenarios with achieved cost ...

The energy savings in rail transport will play an important role in achieving this target. In rail transport, the consumption of traction energy accounts for about 60% to 80% of the total energy consumption ...

Embracing the principle of railway-oriented safety, a collaborative RBEUS-TPSS protection scheme is put forth. Finally, through simulated scenarios encompassing various fault ...

To achieve energy conservation and consumption reduction in the traction system while maintaining the operational lifespan of the battery, this paper proposes an energy management ...

Railway solar container braking
