

Why do photovoltaic modules benefit from hybrid cooling system (paraffin wax & CuO nanoparticles)?

This improvement is attributed to the enhanced thermal conductivity of copper oxide nanoparticles, which optimized latent heat transfer within the phase change material. Table 5 Performance impact of hybrid cooling system (paraffin wax + CuO nanoparticles) on photovoltaic modules.

Can a hybrid phase-change material improve PV thermal management?

The efficiency of photovoltaic (PV) panels significantly decreases due to temperature rise under solar irradiation, a critical challenge especially in hot climates. This study addresses this issue by developing a highly efficient hybrid phase-change material (PCM) for PV thermal management.

Can natural wax improve the performance of solar air heater system?

The natural wax could serve as good PCM candidate to improve the performance of the solar air heater system. Using ex-bottles of milk as PCM containers can reduce environmental pollution. Solar Air Heater (SAH) technology as a drying method for agricultural commodities is only active during the day and is highly dependent on the weather.

Does nanoparticle agglomeration affect thermal conductivity of paraffin wax?

Figure 4 data demonstrate a significant thermal conductivity enhancement of 381.8% at the optimal concentration (2 wt%), with a pronounced reduction observed at higher concentrations due to nanoparticle agglomeration phenomena. Effect of copper oxide nanoparticles on thermal conductivity of paraffin wax.

Do CuO NPs change the melting and solidification points of paraffin wax?

Differential Scanning Calorimetry (DSC) analysis confirmed that the addition of up to 2 wt% CuO NPs did not significantly alter the melting and solidification points of the paraffin wax, ensuring the latent heat storage functionality remained the primary cooling mechanism.

Does nano-enhanced paraffin improve thermal regulation and electrical output?

Table 5 presents performance data for the system integrated with nano-enhanced paraffin (PCM/CuO NPs,  $k = 2.15 \text{ W/m K}$ ) recorded on 18 July 2024, demonstrating superior thermal regulation and electrical output compared to conventional systems.
