Why do inductor suppliers need a small size inverter system?

Inverter suppliers are facing tough demands for reduced inverter system size and higher efficiency. So the challenge for the inductor supplier is to provide an inductor at a small size with high current capability and minimal heat dissipation.

Do solar inverters need inductors?

Solar inverters need inductors that are capable of handling high voltages and large currents in the main circuit. Panasonic inductors, thanks to their high-quality design, can meet these requirements ensuring a stable inductance value during lifetime.

What are power inductor specifications?

Power inductor specifications typically include inductance value ( $\mu\text{H}$ ), rated current (A), saturation current (A), and DCR ( $\text{m}\Omega$ ) as the main parameters. Inductors, as key components in electronic circuits, can be classified into various types based on structure, manufacturing process, and application scenarios.

What determines the size of an inductor?

The size of an inductor - how small it can be - is usually determined by the inductance value and acceptable losses, whether DC or AC. Both of these are critical parameters when choosing inductors, but numerous other parameters are also important when comparing and selecting inductors for different applications.

What is a good inductance value for a DC-to-DC converter?

When the requirements are not as tight (e.g., in a DC-to-DC converter), an inductance value with wider tolerance, such as  $\pm 20\%$ , can be used. A number of inductor parameters relate to current. This presents interesting challenges since an inductor's current handling ability can vary greatly by application.

How do I Choose an inductor for a high-order filter or impedance-matching application?

For higher-order filter or impedance-matching applications, it is more important to have a relatively flat inductance curve (constant inductance as a function of frequency) close to the frequency of interest. This suggests selecting an inductor with an SRF that is well above the design frequency.
